# Office Action Summary

Application No.

10/025,270

Applicant(s)

SYME ET AL.

Examiner

Michael J. Yigdall

Art Unit

2192

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☒ Responsive to communication(s) filed on 02 June 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 1-14, 25 and 26 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-14, 25 and 26 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

## Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### DETAILED ACTION

1. Applicant's amendment and response filed on June 2, 2005 has been fully considered.  
Claims 1-14, 25 and 26 remain pending.

### *Response to Arguments*

2. Applicant's arguments have been fully considered but they are not persuasive.

Applicant contends that Viroli does not disclose or anticipate dynamic allocation in a data structure. Applicant further states, "A somewhat corresponding data structure in Viroli is called 'STDManager (Type Descriptors Manager).... Methods and fields of STDManager will be declared static.' (p. 8, paragraph 4.1)" (Applicant's remarks, page 12, first paragraph).

However, in the Java language, a declaration of "static" is not the same as static allocation. A method that is declared static is simply a method that is called without first creating an instance of the class. Viroli teaches that a static method of the STDManager class is called to perform dynamic allocation in a data structure (see, for example, page 11, section 4.1), as reproduced here with emphasis added:

To speed up the prevention of double registrations STDManager will use a Hashtable structure containing STD objects. When a client class wants to register a type descriptor, say the one for type Cell<Integer>, it will call a method STDManager.register passing it the object Integer.class and an array of STD which contains the type descriptor for class Integer (assuming it is already available). This method will check for the existence of a type descriptor with the same properties in the hash table, if it exists it is returned. Otherwise a new one is created, a unique identifier is assigned to it, it is stored in the hash table and finally it is returned.

Therefore, Viroli anticipates the step of “dynamically allocating a field in the typing context data structure associated with the typing-context-relevant-code-point,” as presented in the claim rejections below.

***Claim Rejections - 35 USC § 101***

3. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

4. Claims 1-14 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Claims 1-14 are not limited to tangible embodiments. The claims are directed to “a computer program product encoding a computer program.” In view of Applicant’s disclosure (for example, specification, page 4, first paragraph), the computer program product is not limited to tangible embodiments, and is instead defined to include both tangible embodiments (such as “a computer program storage medium”) and intangible embodiments (such as “a computer data signal embodied in a carrier wave”). As such, the claims are not limited to statutory subject matter and are therefore non-statutory.

***Claim Rejections - 35 USC § 102***

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

6. Claims 1-5, 7-9, 25 and 26 are rejected under 35 U.S.C. 102(b) as being anticipated by Viroli et al., "Parametric Polymorphism in Java through the Homogeneous Translation LM: Gathering Type Descriptors at Load-Time" (art of record, "Viroli").

With respect to claim 1 (currently amended), Viroli discloses a computer program product encoding a computer program for executing on a computer system a computer process for dynamically generating typing context data (see, for example, the abstract, and page 6, section 3, which shows a translation to dynamically generate type descriptor objects, and see, for example, page 8, Figure 4, which shows a type descriptor) associated with a typing-context-relevant-code-point being executed within a typing context in a dynamic execution environment (see, for example, page 11, section 4.1, first paragraph, which shows instantiating parametric types), the computer process comprising:

(a) encountering the typing-context-relevant-code-point in the typing context during execution of the program (see, for example, page 6, section 3, which shows encountering a type operation);

(b) identifying a typing context handle associated with the typing context, the typing context handle referencing a typing context data structure associated with the typing context (see, for example, page 12, section 4.2, first paragraph, which shows a type descriptor manager, type descriptors and hash tables);

(c) computing the typing context data associated with the typing-context-relevant-code-point (see, for example, page 6, section 3, which shows the translation, and page 11, section 4.1, first paragraph, which shows instantiating the parametric types);

(d) dynamically allocating a field in the typing context data structure associated with the typing-context-relevant-code-point (see, for example, page 11, section 4.1, third paragraph, which shows dynamically allocating a type descriptor); and

(e) recording the typing context data in the field of the typing context data structure (see, for example, page 11, section 4.1, second and third paragraphs, which shows recording the type descriptor in a hash table).

With respect to claim 2 (original), the rejection of claim 1 is incorporated, and Viroli further discloses the limitations wherein the typing-context-relevant-code-point executes a type test on an instance of a generic class (see, for example, page 8, first paragraph, which shows instance tests), the typing context data includes a resource type descriptor defining the exact type of the instance (see, for example, page 8, Figure 4, which shows a type descriptor, and page 11, section 4.1, second and third paragraphs, which shows an array of type descriptors and the exact type of the instance), and the computer process further comprises: performing the type test based on the resource type descriptor associated with the typing-context-relevant-code-point (see, for example, page 8, first paragraph, which shows performing the instance test based on the type).

With respect to claim 3 (original), the rejection of claim 1 is incorporated, and Viroli further discloses the limitations wherein the typing-context-relevant-code-point executes an allocation of an instance of a generic class (see, for example, page 11, section 4.1, first paragraph, which shows instantiating a parametric type), the typing context data includes a resource type descriptor defining the exact type of the instance (see, for example, page 8, Figure 4, which shows a type descriptor, and page 11, section 4.1, second and third paragraphs, which

Art Unit: 2192

shows an array of type descriptors and the exact type of the instance), and the computer process further comprises: creating the instance of the generic class based on the resource type descriptor associated with the typing-context-relevant-code-point, wherein the instance is of the exact type (see, for example, page 11, section 4.1, first three paragraphs, which shows creating an instance based on the type, and page 12, last paragraph, second bullet).

With respect to claim 4 (original), the rejection of claim 1 is incorporated, and Viroli further discloses the limitations wherein the typing-context-relevant-code-point calls a generic method, the typing context data includes another typing context handle, and the computer process further comprises: passing the other typing context handle referencing the typing context data to the generic method as a hidden parameter (see, for example, page 12, first paragraph, which shows calling a method for friend types).

With respect to claim 5 (original), the rejection of claim 1 is incorporated, and Viroli further discloses the limitation wherein the identifying operation comprises: retrieving the typing context handle from a stack frame (see, for example, the abstract, which shows a Java virtual machine).

With respect to claim 7 (original), the rejection of claim 1 is incorporated, and Viroli further discloses the limitation wherein the computing operation comprises: retrieving the typing context data associated with the typing-context-relevant-code-point from a global hash table (see, for example, page 11, section 4.1, third paragraph, which shows retrieving the type descriptor from a hash table).

Art Unit: 2192

With respect to claim 8 (original), the rejection of claim 1 is incorporated, and Viroli further discloses the limitation wherein the encountering operation comprises: assigning an index to the typing-context-relevant-code-point (see, for example, page 11, section 4.1, third paragraph, which shows assigning a unique identifier).

With respect to claim 9 (original), the rejection of claim 8 is incorporated, and Viroli further discloses the limitation wherein the allocating operation comprises: allocating the field in the typing context data structure, in accordance with the index (see, for example, page 11, section 4.1, third paragraph, which shows dynamically allocating a type descriptor in accordance with a unique identifier).

With respect to claim 25 (currently amended), the execution engine recited in the claim corresponds to the computer program product of claim 1 (see the rejection of claim 1 above).

With respect to claim 26 (currently amended), the method recited in the claim corresponds to the computer program product of claim 1 (see the rejection of claim 1 above).

### *Claim Rejections - 35 USC § 103*

7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

8. Claims 6 and 10-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Viroli, as applied to claim 1 above, in view of U.S. Pat. No. 5,093,914 to Coplien et al. (art of record, "Coplien").

With respect to claim 6 (original), the rejection of claim 1 is incorporated, and Viroli further discloses the limitation wherein the typing-context-relevant-code-point is executed within an instance of a generic class (see, for example, page 11, section 4.1, first paragraph, which shows instantiating a parametric type). Viroli does not expressly disclose the limitation wherein the identifying operation comprises:

- (a) retrieving a first pointer to the instance; and
- (b) retrieving the typing context handle via a second pointer, a second pointer being relative to the first point and referencing the typing context handle associated with the instance.

However, Coplien teaches step (a) above in terms of a first pointer to a window instance (see, for example, column 10, lines 14-21). Coplien further teaches step (b) above in terms of second pointer to a generic window (see, for example, column 10, lines 23-29) that is relative to the first pointer (see, for example, column 10, lines 31-35) and references type information associated with the instance (see, for example, column 10, lines 37-47).

Coplien is directed to executing parameterized polymorphic code (see, for example, column 10, lines 48-65). It would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teachings of Coplien into Viroli so as to include first and second pointers. The motivation for doing so would have been to facilitate the sharing of base or generic code by specific type instances or subclasses deriving from the same generic

Art Unit: 2192

or base class or object, thus eliminating redundant code in subclasses which prefer the default semantics defined in the base class.

With respect to claim 10 (original), the rejection of claim 8 is incorporated. Viroli does not expressly disclose the limitation wherein the index is assigned based on the “arity” of the typing-context-relevant-code-point.

However, Coplien discloses this limitation in terms of an index based on the number of arguments (see, for example, column 12, lines 35-42).

Coplien is directed to executing parameterized polymorphic code (see, for example, column 10, lines 48-65). It would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teachings of Coplien into Viroli so as to assign the index based on “arity.” The motivation for doing so would have been to facilitate the construction of function signatures (each consists of a function name and the number of arguments), for the purpose of organizing and identifying like-named functions that have different argument lists.

With respect to claim 11 (original), the rejection of claim 8 is incorporated. Viroli does not expressly disclose the limitation wherein the index is assigned based on a category associated with the typing-context-relevant-code-point.

However, Coplien discloses this limitation in terms of an index based on a category such as the number of arguments (see, for example, column 12, lines 35-42).

Coplien is directed to executing parameterized polymorphic code (see, for example, column 10, lines 48-65). It would have been obvious to one of ordinary skill in the art at the

time the invention was made to incorporate the teachings of Coplien into Viroli so as to assign the index based on a category. The motivation for doing so would have been to facilitate the construction of function signatures (each consists of a function name and the number of arguments), for the purpose of organizing and identifying like-named functions that have different argument lists.

With respect to claim 12 (original), the rejection of claim 11 is incorporated, and Coplien further teaches the limitation wherein the category is assigned on a per-containing class basis (see, for example, FIG. 7, which shows an “XWindow” object and a “SunviewWindow” object).

With respect to claim 13 (original), the rejection of claim 11 is incorporated, and Coplien further teaches the limitation wherein the category is assigned on a per-containing method basis (see, for example, FIG. 7, which shows an “XWindow::draw” method and a “SunviewWindow::draw” method).

With respect to claim 14 (original), the rejection of claim 11 is incorporated, and Coplien further teaches the limitation wherein the category is assigned on a per-containing assembly basis (See, for example, FIG. 7, which shows an “XWindow” implementation and a “SunviewWindow” implementation).

### *Conclusion*

9. Applicant’s amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

Art Unit: 2192

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

10. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Michael J. Yigdall whose telephone number is (571) 272-3707. The examiner can normally be reached on Monday through Friday from 7:30am to 4:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tuan Q. Dam can be reached on (571) 272-3695. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
